

第7周作业参考解答

p. 103 习题 13.1, 3, 4, 5, 6, 7, 9.

3. 证明: 反证法。假设 $\exists P_0(x_0, y_0) \in D$ 使得 $f(x_0, y_0) \neq 0$, 不妨设 $f(x_0, y_0) > 0$. 由于 $f(x, y) \in C(D)$, 由极限的保号性, $\exists \delta > 0$ 使得对 $\forall (x, y) \in \mathcal{B}(P_0, \delta) \cap D$, 有

$$f(x, y) > \frac{1}{2} f(x_0, y_0) > 0,$$

因此

$$\iint_D f(x, y) d\sigma \geq \iint_{\mathcal{B}(P_0, \delta) \cap D} f(x, y) d\sigma > \frac{1}{2} f(x_0, y_0) \pi \delta^2 > 0,$$

这与条件矛盾, 故 $f(x, y) \equiv 0$. 证毕

4. 证明: 反证法。假设 $\exists P_0(x_0, y_0) \in D$ 使得 $f(x_0, y_0) \neq 0$, 不妨设 $f(x_0, y_0) > 0$. 由于 $f(x, y) \in C(D)$, 由极限的保号性, $\exists \delta > 0$ 使得对 $\forall (x, y) \in \mathcal{B}(P_0, \delta)$, 有

$$f(x, y) > \frac{1}{2} f(x_0, y_0) > 0,$$

因此 $\iint_{\mathcal{B}(P_0, \delta)} f(x, y) d\sigma \neq 0$, 与条件矛盾, 故 $f(x, y) \equiv 0$. 证毕

5. 解: 由积分中值定理, 在 $(0, 0)$ 的邻域内存在 (x_r, y_r) 使得

$$\iint_{x^2+y^2 \leq r^2} f(x, y) d\sigma = \pi r^2 f(x_r, y_r).$$

由于 $f(x, y)$ 在 $(0, 0)$ 的邻域内连续, 因此

$$\lim_{r \rightarrow 0^+} \frac{1}{r^2} \iint_{x^2+y^2 \leq r^2} f(x, y) d\sigma = \lim_{r \rightarrow 0^+} \pi f(x_r, y_r) = \pi f(0, 0).$$

6. 解: (1) 积分区域 D 关于直线 $y = x$ 对称, 被积函数 $x + y > 1$, 因此有

$$\iint_D (x+y)^3 d\sigma > \iint_D (x+y)^2 d\sigma.$$

(2) 因为 $\frac{1}{2} \leq x+y \leq 1$, 因此 $\ln(x+y) \leq 0$, 从而 $\iint_D \ln(x+y) d\sigma < 0$, 而 $\iint_D xy d\sigma > 0$,

故 $\iint_D \ln(x+y) d\sigma < \iint_D xy d\sigma$.

7. 解: 因为积分区域 $\{(x, y) | x^2 + y^2 \leq R^2\}$ 关于直线 $y = x$ 对称, 因此

$$\iint_{x^2+y^2 \leq R^2} \frac{af(x)+bf(y)}{f(x)+f(y)} d\sigma = \iint_{x^2+y^2 \leq R^2} \frac{af(y)+bf(x)}{f(x)+f(y)} d\sigma = \frac{1}{2} \pi(a+b)R^2.$$

9. (1) 曲面 $z = \sqrt{x^2 + y^2}$ 是圆锥, 因此 $\iint_{x^2+y^2 \leq R^2} \sqrt{x^2 + y^2} d\sigma$ 是底面圆半径都是 R , 高都为

R 的圆柱体体积减去圆锥的体积, 故 $\iint_{x^2+y^2 \leq R^2} \sqrt{x^2 + y^2} d\sigma = \pi R^3 - \frac{1}{3} \pi R^3 = \frac{2}{3} \pi R^3.$

(2) $\iint_{|x|+|y| \leq 1} d\sigma$ 是边长为 $\sqrt{2}$ 的正方形面积, 故 $\iint_{|x|+|y| \leq 1} d\sigma = 2.$

p.114, 习题 13.2, 1(1), (2), 2, 3, 5(3), (5), 6(1), (2), (4), 7(1), (3), 8(2), 9.

$$1. (1) \int_0^1 \left(\int_{2\sqrt{1-x}}^{\sqrt{4-x^2}} f(x, y) dy \right) dx + \int_1^2 \left(\int_0^{\sqrt{4-x^2}} f(x, y) dy \right) dx = \int_0^2 \left(\int_{1-\frac{y^2}{4}}^{\sqrt{4-y^2}} f(x, y) dx \right) dy;$$

$$(2) \int_1^2 \left(\int_{2-x}^{\sqrt{2x-x^2}} f(x, y) dy \right) dx = \int_0^1 \left(\int_{2-y}^{1+\sqrt{1-y^2}} f(x, y) dx \right) dy.$$

$$2. (1) \int_0^1 \left(\int_{y-1}^{1-y} f(x, y) dx \right) dy \text{ 或 } \int_{-1}^0 \left(\int_0^{1+x} f(x, y) dy \right) dx + \int_0^1 \left(\int_0^{1-x} f(x, y) dy \right) dx;$$

$$(2) \int_{-1}^2 \left(\int_{y^2}^{y+2} f(x, y) dx \right) dy \text{ 或 } \int_0^1 \left(\int_{-\sqrt{x}}^{\sqrt{x}} f(x, y) dy \right) dx + \int_1^4 \left(\int_{x-2}^{\sqrt{x}} f(x, y) dy \right) dx.$$

3. 积分区域如图所示

$$\text{令} \begin{cases} x = r \cos \theta \\ y = r \sin \theta \end{cases}$$

$$\text{则 } D_2 = \{(r, \theta) \mid 0 \leq r \leq 2a \sin \theta, 0 \leq \theta \leq \frac{\pi}{4}\},$$

$$D_1 = \{(r, \theta) \mid 0 \leq r \leq 2a \cos \theta, \frac{\pi}{4} \leq \theta \leq \frac{\pi}{2}\}$$

$$\text{注意到 } \left| \det \frac{\partial(x, y)}{\partial(r, \theta)} \right| = r, \text{ 所以}$$

$$\iint_D f(x, y) dx dy = \int_0^{\frac{\pi}{4}} d\theta \int_0^{2a \sin \theta} f(r \cos \theta, r \sin \theta) r dr + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} d\theta \int_0^{2a \cos \theta} f(r \cos \theta, r \sin \theta) r dr.$$

5. (3) 解: 记 $D_1 = \{(x, y) \mid x^2 + y^2 \leq R^2, x \geq 0, y \geq 0\}$, 则由对称性可得

$$\iint_D |xy| dx dy = 4 \iint_{D_1} |xy| dx dy = 4 \int_0^R dy \int_0^{\sqrt{R^2-y^2}} xy dx = \frac{1}{2} R^4.$$

(5) 解: 极坐标变换, 令 $\begin{cases} x = r \cos \theta \\ y = r \sin \theta \end{cases}$ 则积分区域 D 在极坐标系下表示为

$$D_{r\theta} = \{(r, \theta) \mid -\frac{\pi}{4} \leq \theta \leq \frac{3\pi}{4}, 0 \leq r \leq \sin \theta + \cos \theta\},$$

所以

$$\begin{aligned} \iint_D (x+y) dx dy &= \int_{-\frac{\pi}{4}}^{\frac{3\pi}{4}} d\theta \int_0^{\sin \theta + \cos \theta} r^2 (\sin \theta + \cos \theta) dr = \frac{1}{3} \int_{-\frac{\pi}{4}}^{\frac{3\pi}{4}} (\sin \theta + \cos \theta)^4 d\theta \\ &= \frac{4}{3} \int_{-\frac{\pi}{4}}^{\frac{3\pi}{4}} \sin^4(\theta + \frac{\pi}{4}) d\theta = \frac{8}{3} \int_0^{\frac{\pi}{2}} \sin^4 t dt = \frac{\pi}{2}. \end{aligned}$$

解法二、令 $\begin{cases} x = \frac{1}{2} + r \cos \theta \\ y = \frac{1}{2} + r \sin \theta \end{cases}$ 则积分区域 D 在极坐标系下表示为

$$D_{r\theta} = \{(r, \theta) \mid 0 \leq \theta \leq 2\pi, 0 \leq r \leq \frac{1}{\sqrt{2}}\},$$

$$\text{所以 } \iint_D (x+y) dx dy = \int_0^{2\pi} d\theta \int_0^{\frac{1}{\sqrt{2}}} [1 + r(\sin \theta + \cos \theta)] r dr = \int_0^{2\pi} d\theta \int_0^{\frac{1}{\sqrt{2}}} r dr = \frac{\pi}{2}.$$

6. (1) 解: 令 $\begin{cases} u = x+3y \\ v = y-x \end{cases}$ 则 $\Omega = \{(u, v) \mid 5 \leq u \leq 7, -3 \leq v \leq 1\}$, 且 $\left| \det \frac{\partial(x, y)}{\partial(u, v)} \right| = \frac{1}{4}$, 所

$$\text{以 } \iint_D (y-x) dx dy = \frac{1}{4} \int_{-3}^1 dv \int_5^7 v du = -2.$$

(2) 解: 令 $\begin{cases} u = xy \\ v = \frac{y}{x} \end{cases}$ 则 $\Omega = \{(u, v) \mid 1 \leq u \leq 2, 1 \leq v \leq 4\}$, 且 $\left| \det \frac{\partial(x, y)}{\partial(u, v)} \right| = \frac{1}{2v}$, 所以

$$\iint_D (x^2 + y^2 + 1) dx dy = \int_1^2 du \int_1^4 \left(\frac{u}{v} + uv + 1 \right) \frac{1}{2v} dv = \int_1^2 \left(\frac{15}{8} u + \ln 2 \right) du = \frac{45}{16} + \ln 2.$$

(4) 解: 令 $\begin{cases} u = x+y \\ v = x-y \end{cases}$ 则 $\Omega = \{(u, v) \mid -1 \leq u \leq 1, -1 \leq v \leq 1\}$, 且 $\left| \det \frac{\partial(x, y)}{\partial(u, v)} \right| = \frac{1}{2}$, 所以

$$\iint_D (x^2 + y^2) dx dy = \frac{1}{4} \int_{-1}^1 du \int_{-1}^1 (u^2 + v^2) dv = \frac{2}{3}.$$

7. (1) 解: 令 $\begin{cases} x = r \cos \theta \\ y = r \sin \theta \end{cases}$ 则在极坐标系下, 积分区域 D 变换为

$$D_{r\theta} = \{(r, \theta) | 0 \leq r \leq \sqrt{\cos^4 \theta + \sin^4 \theta}, 0 \leq \theta \leq 2\pi\}.$$

故

$$S = \iint_D dx dy = \int_0^{2\pi} \int_0^{\sqrt{\sin^4 \theta + \cos^4 \theta}} r dr d\theta = \int_0^{2\pi} \frac{1}{2} (\sin^4 \theta + \cos^4 \theta) d\theta = \int_0^{2\pi} \sin^4 \theta d\theta = \frac{3\pi}{4}.$$

(3) 解: 积分区域 D 在第一象限的部分区域在极坐标系下表示为

$$\left\{ (r, \theta) | 0 \leq \theta \leq \frac{\pi}{2}, 0 \leq r \leq 2a\sqrt{\sin 2\theta} \right\}.$$

$$\text{故所求面积 } S = \iint_D dx dy = 2 \int_0^{\frac{\pi}{2}} d\theta \int_0^{2a\sqrt{\sin 2\theta}} r dr = 4a^2 \int_0^{\frac{\pi}{2}} \sin 2\theta d\theta = 4a^2.$$

8. (2) 解: 两曲面的交线的投影柱面为 $x^2 + y^2 = 2$, 故可得立体的投影区域在极坐标系

下为 $D = \{(r, \theta) | 0 \leq r \leq \sqrt{2}, 0 \leq \theta \leq 2\pi\}$, 从而所求立体的体积为

$$V = \iint_D (6 - 3x^2 - 3y^2) dx dy = 3 \int_0^{2\pi} d\theta \int_0^{\sqrt{2}} (2 - r^2) r dr = 6\pi.$$

9. 证明: (1) 令 $\begin{cases} u = x + y \\ v = x - y \end{cases}$ 则 $\Omega = \{(u, v) | -1 \leq u \leq 1, -1 \leq v \leq 1\}$. 注意到

$$\left| \det \frac{\partial(x, y)}{\partial(u, v)} \right| = \frac{1}{2}, \text{ 所以}$$

$$\iint_D f(x + y) dx dy = \frac{1}{2} \int_{-1}^1 du \int_{-1}^1 f(u) dv = \int_{-1}^1 f(u) du = \int_{-1}^1 f(t) dt. \text{ 证毕.}$$

(2) 令 $\begin{cases} u = xy \\ v = \frac{y}{x} \end{cases}$ 则 $\Omega = \{(u, v) | 1 \leq u \leq 2, 1 \leq v \leq 4\}$. 注意到 $\left| \det \frac{\partial(x, y)}{\partial(u, v)} \right| = \frac{1}{2v}$,

$$\text{所以 } \iint_D f(xy) dx dy = \int_1^2 du \int_1^4 \frac{f(u)}{2v} dv = \ln 2 \int_1^2 f(u) du = \ln 2 \int_1^2 f(t) dt, \text{ 证毕.}$$
