

第25讲. 数项级数.

作业: P210. 1 ③. ⑥. ⑦. ⑧. ⑨. 2. 4.

P220. 1 ②. ③. ④. ⑤. ⑧. ⑨. ⑩. 2 ⑤. ⑥. ⑦. 4. 6 ⑪.

$$\{u_n\} \subset \mathbb{R}$$

$$u_1 + u_2 + u_3 + \cdots + u_n + \cdots$$

↓
通项 (一般项)

$$\sum_{n=1}^{\infty} u_n \quad (\text{数项级数})$$

$$\parallel$$

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n u_k$$

 $S_n = u_1 + u_2 + \cdots + u_n$ — 前 n 项部分和.

$$\{S_n\}$$

若 $\lim_{n \rightarrow \infty} S_n = S$. 则称 $\sum_{n=1}^{\infty} u_n$ 收敛. 且 $\sum_{n=1}^{\infty} u_n = S$. S 称为 $\sum_{n=1}^{\infty} u_n$ 和.

若 $\{S_n\}$ 极限不存在. 则 $\sum_{n=1}^{\infty} u_n$ 发散.

$$r_n = S - S_n = \sum_{k=n+1}^{\infty} u_k \quad \text{— 称为 } \sum_{n=1}^{\infty} u_n \text{ 第 } n \text{ 项余和.}$$

$$\lim_{n \rightarrow \infty} r_n = 0.$$

—— n 项级数.

例1. 讨论 $\sum_{n=1}^{\infty} ar^{n-1}$ 收敛性. $a \neq 0$. r 为常数.

$$|r| \neq 1. \quad S_n = \sum_{k=1}^n ar^{k-1} = \frac{a(1-r^n)}{1-r}$$

1°. $|r| < 1$. $\lim_{n \rightarrow \infty} S_n = \frac{a}{1-r}$. 收敛.

2°. $|r| > 1$. $\lim_{n \rightarrow \infty} S_n$ 不存在. 发散.

3°. $r = 1$. $\sum_{n=1}^{\infty} ar^{n-1} = a + a + \cdots$

$$S_n = na \rightarrow \infty \quad (n \rightarrow \infty) \quad \text{发散.}$$

4°. $r = -1$. $\sum_{n=1}^{\infty} ar^{n-1} = a - a + a - a + a + \cdots$

$$S_n = \begin{cases} 0 & n=2k \\ a & n=2k+1 \end{cases}$$

$\lim_{n \rightarrow \infty} S_n$ 不存在. 发散.

$$\therefore \sum_{n=1}^{\infty} ar^{n-1} \begin{cases} \text{收敛, 和 } \frac{a}{1-r}, & |r| < 1 \\ \text{发散,} & |r| > 1 \end{cases}$$

例2. 求 $0.\dot{7}$

$$0.\dot{7} = 0.7 + 0.07 + \dots = \sum_{n=1}^{\infty} \frac{7}{10^n} = \frac{\frac{7}{10}}{1 - \frac{1}{10}} = \frac{7}{9}.$$

$$0.\dot{9} = 1.$$

例3. 证明: 调和级数 $\sum_{n=1}^{\infty} \frac{1}{n}$ 发散

证: 令 $f(x) = \ln x \quad x \in [n, n+1]$.

$$\ln(1+n) - \ln n = \frac{1}{n+\theta} < \frac{1}{n} \quad \theta \in (0, 1)$$

$$S_n = \sum_{k=1}^n \frac{1}{k} > \sum_{k=1}^n (\ln(1+k) - \ln k) = \ln(1+n) \rightarrow +\infty. \quad (n \rightarrow \infty)$$

$\therefore \sum_{n=1}^{\infty} \frac{1}{n}$ 发散.

$$S_n = \sum_{k=1}^n u_k$$

$$\{S_n\} \Leftrightarrow \forall \varepsilon > 0, \exists N > 0, \forall n > N, \forall p \geq 1.$$

$$|S_n - S_{n+p}| < \varepsilon.$$

||

$$|u_{n+1} + \dots + u_{n+p}|$$

定理1. (Cauchy 收敛) $\sum_{n=1}^{\infty} u_n$ 收敛 $\Leftrightarrow \forall \varepsilon > 0, \exists N > 0, \forall n > N, \forall p \geq 1,$

$$|u_{n+1} + \dots + u_{n+p}| < \varepsilon.$$

性质1. $\sum_{n=1}^{\infty} u_n$ 收敛性与其任意前有限项无关. 即 $\sum_{n=1}^{\infty} u_n$ 与 $\sum_{k=N}^{\infty} u_k$ 收敛性相同.

推论1. 设 $\sum_{n=1}^{\infty} u_n$ 收敛. 则 $\lim_{n \rightarrow \infty} u_n = 0$.

$$\forall \varepsilon > 0. \quad \exists N > 0. \quad \forall n > N. \quad |u_{n+1}| < \varepsilon$$

推论2. 若 $\lim_{n \rightarrow \infty} u_n \neq 0$. 则 $\sum_{n=1}^{\infty} u_n$ 发散.

定理2. ① 设 $\sum_{n=1}^{\infty} u_n = S$. 则 $\forall c \in \mathbb{R}$. $\sum_{n=1}^{\infty} c u_n = cS$

② 设 $\sum_{n=1}^{\infty} u_n = S$. $\sum_{n=1}^{\infty} v_n = A$. 则 $\sum_{n=1}^{\infty} (u_n \pm v_n) = S \pm A$

定理3. 设 $\sum_{n=1}^{\infty} u_n$ 收敛且 $\sum_{n=1}^{\infty} u_n = S$. 则不改变级数各项位置. 按原有顺序将某些项结合在一起. 得到新级数

$$(u_1 + u_2 + \dots + u_{n_1}) + (u_{n_1+1} + \dots + u_{n_2}) + \dots + (u_{n_{k-1}+1} + \dots + u_{n_k}) + \dots$$

收敛. 且和也为 S .

证: $S_n = \sum_{k=1}^n u_k \quad \lim_{n \rightarrow \infty} S_n = S$

$$P_k = (u_1 + \dots + u_{n_1}) + \dots + (u_{n_{k-1}+1} + \dots + u_{n_k}) = S_{n_k} \rightarrow S \quad (k \rightarrow \infty)$$

$\therefore$ 收敛. 且和不变.

$$1 - 1 + 1 - 1 + \dots$$

推论2. 若 $\sum_{k=1}^{\infty} (u_{n_{k-1}+1} + \dots + u_{n_k})$ 收敛. 则 $\sum_{n=1}^{\infty} u_n$ 收敛.

$$\sum_{n=1}^{\infty} u_n$$

$$\int_1^{+\infty} u(x) dx$$

$$u_n > 0, \quad \forall n \geq 1.$$

$$u_n \leq 0, \quad \forall n \geq 1.$$

$$\left. \begin{array}{l} \sum_{n=1}^{\infty} u_n \text{ 正项级数} \\ \sum_{n=1}^{\infty} u_n \text{ 负项级数} \end{array} \right\} \text{ 同号级数.}$$

$$\sum_{n=1}^{\infty} (-u_n)$$

设 $\sum_{n=1}^{\infty} u_n$ 正项级数.

$$S_{n+1} = S_n + u_{n+1} \geq S_n$$

定理3. 设 $u_n > 0$ ($\forall n \geq 1$). 则 $\sum_{n=1}^{\infty} u_n$ 收敛 $\Leftrightarrow$ 其部分和 $\{S_n\}$ 有上界.

定理3. 设 $u_n > 0$ ($\forall n \geq 1$). 则 $\sum_{n=1}^{\infty} u_n$ 收敛 $\Leftrightarrow$ 部分和 $\{S_n\}$ 有上界.

例2. 讨论 $\sum_{n=1}^{\infty} \frac{1}{n^p}$ 的敛散性. $p \in \mathbb{R}$.

(p 又调和级数, 或 p -级数)

$$\int_1^{+\infty} \frac{1}{x^p} dx \begin{cases} \text{收敛} & p > 1 \\ \text{发散} & p \leq 1 \end{cases}$$

证: 1° $p=1$. $\sum_{n=1}^{\infty} \frac{1}{n}$ 发散.

2° $p < 1$.

$$\frac{1}{n^p} > \frac{1}{n} \quad \forall n > 1.$$

$$S_n = \sum_{k=1}^n \frac{1}{k^p} > \sum_{k=1}^n \frac{1}{k} \rightarrow +\infty \quad (n \rightarrow \infty).$$

$\therefore$ 发散.

3° $p > 1$. $\forall x \in [n, n+1]$.

$$\frac{1}{(n+1)^p} \leq \int_n^{n+1} \frac{1}{x^p} dx \leq \frac{1}{n^p} \quad n > 1.$$

$$S_n \leq 1 + \int_1^n \frac{1}{x^p} dx \leq 1 + \int_1^{+\infty} \frac{1}{x^p} dx = 1 + \frac{1}{p-1}$$

$\therefore$ 收敛.

$$\sum_{n=1}^{\infty} \frac{1}{n^p} \begin{cases} \text{收敛} & p > 1 \\ \text{发散} & p \leq 1 \end{cases}$$

定理4. 设 $\sum_{n=1}^{\infty} u_n$, $\sum_{n=1}^{\infty} v_n$ 是正项级数, 且 $\exists N > 0, \forall n > N, u_n \leq c v_n$ ($c > 0$)

①. 若 $\sum_{n=1}^{\infty} v_n$ 收敛, 则 $\sum_{n=1}^{\infty} u_n$ 收敛

②. 若 $\sum_{n=1}^{\infty} u_n$ 发散, 则 $\sum_{n=1}^{\infty} v_n$ 发散.

设 $u_n \leq c v_n, \forall n > 1$.

证: $B_n = \sum_{k=1}^n v_k < M$.

$$A_n = \sum_{k=1}^n u_k \leq c \sum_{k=1}^n v_k = c B_n < c M.$$

定理5. 设 $11. > n$ $12. > n$ ($\forall n > 1$) 且 $\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = c$ ($0 < c < +\infty$)

定理5. 设 $u_n \geq 0, v_n > 0, (\forall n \geq 1)$ 且 $\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = c \quad (0 < c < +\infty)$

①. $0 < c < +\infty$. 则 $\sum_n u_n$ 与 $\sum_n v_n$ 有相同的敛性.

②. $c = 0$. 则 $\sum_n v_n$ 收敛 $\Rightarrow \sum_n u_n$ 收敛

③. $c = +\infty$. 则 $\sum_n v_n$ 发散 $\Rightarrow \sum_n u_n$ 发散

证: 设 $\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = c \quad 0 < c < +\infty$.

$$\varepsilon = \frac{1}{2}c \quad \exists N > 0. \quad \forall n > N. \quad \left| \frac{u_n}{v_n} - c \right| < \frac{1}{2}c$$

$$\frac{1}{2}c < \frac{u_n}{v_n} < \frac{3}{2}c$$

$$\frac{1}{2}c v_n < u_n < \frac{3}{2}c v_n$$

$$v_n = \frac{1}{n^p}$$

定理6. 设 $u_n > 0, (\forall n \geq 1)$. 且 $\lim_{n \rightarrow \infty} n^p u_n = c$.

①. $c < +\infty$. 且 $p > 1$. 则 $\sum_n u_n$ 收敛

②. $c > 0$ 或 $c = +\infty$. 则 $\sum_n u_n$ 发散.

且 $p \leq 1$

例3. 判断 $\sum_{n=1}^{\infty} \int_0^{\frac{\pi}{n}} \frac{\sin x}{1+x} dx$ 敛散性.

$$x \in [0, \frac{\pi}{n}]. \quad 0 \leq \sin x \leq x \leq \frac{\pi}{n}$$

$$u_n = \int_0^{\frac{\pi}{n}} \frac{\sin x}{1+x} dx \leq \frac{\pi}{n} \int_0^{\frac{\pi}{n}} \frac{1}{1+x} dx = \frac{\pi}{n} \ln(1 + \frac{\pi}{n}) \leq \frac{\pi^2}{n^2}$$

$$\sum_{n=1}^{\infty} \frac{\pi^2}{n^2} \text{ 收敛.}$$

$$\therefore \sum_n u_n \text{ 收敛.}$$

定理7. 设 $u_n \geq 0, (\forall n \geq 1)$ 且 $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = c \quad (0 < c < +\infty)$

定理7. 设 $u_n \geq 0$, ($\forall n \geq 1$) 且 $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = c$ ($c < +\infty$)

① 若 $c < 1$. 则 $\sum_n u_n$ 收敛.

② 若 $c > 1$ 或 $c = +\infty$. 则 $\sum_n u_n$ 发散.

③ 若 $c = 1$. 则 $\sum_n u_n$ 无法判断收敛性.

$$u_n = \frac{1}{n^p}$$

证: ① $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = c < 1$ 取 ρ . $c < \rho < 1$.

$$\therefore \exists N > 0, \forall n \geq N, \quad \frac{u_{n+1}}{u_n} < \rho.$$

$$u_n < \rho u_{n-1} < \dots < \rho^{n-N} u_N. \quad \sum_{n=N}^{\infty} \rho^{n-N} \text{ 收敛,}$$

$$\therefore \sum_{n=N}^{\infty} u_n \text{ 收敛.}$$

② $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = c > 1$. $c > \rho > 1$

$$\therefore \exists N > 0, \forall n \geq N, \quad \frac{u_{n+1}}{u_n} > \rho.$$

$$u_n > \rho u_{n-1} > \dots > \rho^{n-N} u_N. \quad \sum_{n=N}^{\infty} \rho^{n-N} \text{ 发散.}$$

$$\therefore \sum_n u_n \text{ 发散}$$

$$u_n > 0, \quad \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = c. \Rightarrow \lim_{n \rightarrow \infty} \sqrt[n]{u_n} = c.$$

$\Leftarrow$

定理8. 设 $u_n \geq 0$, ($\forall n \geq 1$). 且 $\lim_{n \rightarrow \infty} \sqrt[n]{u_n} = c$ ($c < +\infty$)

① 若 $c < 1$. 则 $\sum_n u_n$ 收敛

② 若 $c > 1$ 或 $c = +\infty$. 则 $\sum_n u_n$ 发散

③ 若 $c = 1$ 无法判断

② 若 $c=1$ 无法判断.

$$u_n = \frac{1}{n^p}$$

证: ① $\lim_{n \rightarrow \infty} \sqrt[n]{u_n} = c < 1$. $c < 1$

$$\therefore \exists N > 0. \quad \forall n > N. \quad \sqrt[n]{u_n} < \rho$$

$$u_n < \rho^n \quad \sum_{n=N+1}^{\infty} \rho^n < \infty.$$

② $\lim_{n \rightarrow \infty} \sqrt[n]{u_n} = c > 1$.

$$\sum_{n=1}^{\infty} \rho^n$$

$$\rho^n = e^{-n |\ln \rho|}$$

$$0 < \rho < 1$$

定理9. 设 $u_n > 0$ ($\forall n > 1$). 若 $\exists f(x) \in C[1, +\infty)$. $\downarrow$. $f(x) \geq 0$. s.t. $u_n = f(n)$.

则 $\sum_n u_n$ 与 $\int_1^{+\infty} f(x) dx$ 有相同敛散性.

证: $\because f(x) \geq 0$, $F(x) = \int_1^x f(t) dt \quad \uparrow$.

$\therefore \int_1^{+\infty} f(x) dx$ 要么收敛, 要么发散到 $+\infty$.

$$u_n = f(n). \quad \forall x \in [n, n+1].$$

$$u_{n+1} = f(n+1) \leq \int_n^{n+1} f(x) dx \leq f(n) = u_n.$$

$$u_1 + \dots + u_{n+1} = \sum_{k=1}^{n+1} u_k \leq \int_1^{n+1} f(x) dx$$

$$S_n = u_1 + \dots + u_n \leq u_1 + \int_1^n f(x) dx \leq u_1 + \int_1^{+\infty} f(x) dx \quad \text{收敛}$$

$\therefore \int_1^{+\infty} f(x) dx$ 收敛 $\Rightarrow \sum_n u_n$ 收敛.

$$\int_1^{n+1} f(x) dx \leq \sum_{k=1}^n u_k$$

$\therefore \int_1^{+\infty} f(x) dx$ 收敛 $\Rightarrow \sum_n u_n$ 收敛.

例 5. 判断 $\sum_{n=2}^{\infty} \frac{1}{n (\ln n)^p}$ 敛散性. $p \in \mathbb{R}$.

$$\int_2^{+\infty} \frac{1}{x (\ln x)^p} dx = \int_2^{+\infty} \frac{1}{(\ln x)^p} d(\ln x) = \frac{1}{1-p} (\ln x)^{1-p} \Big|_2^{+\infty}$$

$p > 1$. 收敛.

$p < 1$ 发散.

$p = 1$ $\int_2^{+\infty} \frac{1}{x \ln x} dx = \ln(\ln x) \Big|_2^{+\infty} = +\infty$. 发散.

$$f(x) = \frac{1}{x (\ln x)^p}, \quad [2, +\infty).$$

例 6. 判断 $\sum_{n=1}^{\infty} \left[e - \left(1 + \frac{1}{n}\right)^n \right]^p$ 敛散性. $p > 0$.

$$u_n = \left(e - \left(1 + \frac{1}{n}\right)^n \right)^p > 0.$$

$$x = \frac{1}{n} \rightarrow 0 \quad (n \rightarrow \infty)$$

$$e - \left(1 + x\right)^{\frac{1}{x}} = e - e^{\frac{1}{x} \ln(1+x)} = e \left[1 - e^{\frac{\ln(1+x)}{x} - 1} \right]$$

$$e^x = 1 + x + o(x) \quad (x \rightarrow 0)$$

$$\ln(1+x) = x - \frac{1}{2}x^2 + o(x^2) \quad (x \rightarrow 0)$$

$$e^{\frac{\ln(1+x)}{x} - 1} = e^{1 - \frac{1}{2}x + o(x) - 1} = e^{-\frac{1}{2}x + o(x)} \quad (x \rightarrow 0)$$

||

$$1 - \frac{1}{2}x + o(x)$$

$$e - (1+x)^{\frac{1}{x}} = e \left(\frac{1}{x} + o(x) \right) = \frac{e}{x} + o(x) \quad (x \rightarrow 0)$$

$$u_n = \left(\frac{e}{2} \right)^p \cdot \frac{1}{n^p} + o\left(\frac{1}{n^p}\right) \quad (n \rightarrow \infty)$$

$$\lim_{n \rightarrow \infty} n^p \cdot u_n = \left(\frac{e}{2} \right)^p$$

$$p > 1 \quad \sum_n u_n \text{ 收敛}$$

$$p \leq 1 \quad \sum_n u_n \text{ 发散}$$

交错级数: $u_n \geq 0 \quad (\forall n \geq 1)$

$$u_1 - u_2 + u_3 - u_4 + \dots + (-1)^{n-1} u_n + \dots = \sum_{n=1}^{\infty} (-1)^{n-1} u_n$$

定理 8. 设 $u_n \geq 0, (\forall n \geq 1)$ 若 $\sum_{n=1}^{\infty} (-1)^{n-1} u_n$ 收敛

$$①. u_n \geq u_{n+1} \quad (\forall n \geq 1)$$

$$②. \lim_{n \rightarrow \infty} u_n = 0$$

则 $\sum_{n=1}^{\infty} (-1)^{n-1} u_n$ 收敛, 且其和 S 满足 $u_1 - u_2 \leq S \leq u_1$

$$2^\circ. S_n = \sum_{k=1}^n (-1)^{k-1} u_k \quad u_{n+1} - u_{n+2} \leq |S - S_n| \leq u_{n+1}$$

$$\text{证: } S_{2n} = u_1 - (u_2 + u_4) + \dots - u_{2n} \leq u_1$$

$$S_{2n+2} \geq S_{2n} \quad \lim_{n \rightarrow \infty} S_{2n} = S.$$

$$S_{2n+1} = S_{2n} + u_{2n+1}$$

$$\therefore \lim_{n \rightarrow \infty} S_n = S.$$

$$u_1 - u_2 \leq S_{2n} \leq u_1$$

$$\downarrow$$

$$u_1 - u_2 \leq S \leq u_1 \quad (n \rightarrow \infty)$$

例: $\sum_{n=1}^{\infty} \frac{(-1)^n}{n}$ 收敛.

例: $\sum_{n=2}^{\infty} \frac{(-1)^n}{\sqrt{n} + (-1)^n}$ 发散.

$$u_n = \frac{(-1)^n}{\sqrt{n} + (-1)^n} = \frac{(-1)^n (\sqrt{n} - (-1)^n)}{n-1} = \frac{(-1)^n \sqrt{n}}{n-1} - \frac{1}{n-1}$$

$$\sum_{n=2}^{\infty} \frac{(-1)^n \sqrt{n}}{n-1} \quad \text{发散.}$$

$$\frac{\sqrt{n}}{n-1}$$
