

第30讲. Fourier级数收敛.

复习: 设 $f(x)$ 以 2π 为周期. 且 $f(x) \in R[-\pi, \pi]$. 则 $f(x)$ 的 Fourier 系数

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx \quad n \geq 1.$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx \quad n \geq 1.$$

且 $f(x)$ 的 Fourier 级数 $f(x) \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$.

$$\text{令 } S_n(f; x) = \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + b_k \sin kx)$$

即为 $f(x)$ 的 Fourier 级数 n 项部分和.

设 $f(x), g(x) \in R[a, b]$.

$$\text{定义 } \langle f, g \rangle = \int_a^b f(x) g(x) dx.$$

则由此内积诱导了范数 $\|f\|_2 = \sqrt{\langle f, f \rangle} = \left(\int_a^b f(x)^2 dx \right)^{\frac{1}{2}}.$

$$\|f - g\|_2 = \left(\int_a^b (f(x) - g(x))^2 dx \right)^{\frac{1}{2}}.$$

$$\|f(x) - S_n(f; x)\|_2^2 = \langle f(x) - S_n(f; x), f(x) - S_n(f; x) \rangle$$

$$= \langle f(x) - S_n(f; x), f(x) \rangle - \langle f(x) - S_n(f; x), S_n(f; x) \rangle$$

$$\langle f(x) - S_n(f; x), \sin kx \rangle$$

$$\forall k \geq 1.$$

$$= \langle f(x), \sin kx \rangle - \langle S_n(f; x), \sin kx \rangle$$

$$= \int_{-\pi}^{\pi} f(x) \sin kx dx - \left\langle \frac{a_0}{2} + \sum_{l=1}^n (a_l \cos lx + b_l \sin lx), \sin kx \right\rangle$$

$$= \pi b_k - \left\langle \frac{a_0}{2}, \sin kx \right\rangle - \sum_{l=1}^n \left(a_l \underbrace{\langle \cos lx, \sin kx \rangle}_0 + b_l \underbrace{\langle \sin lx, \sin kx \rangle}_{\begin{matrix} 0 & l \neq k \\ \pi & l = k \end{matrix}} \right)$$

$$= \pi b_k - \pi b_k = 0$$

$$k \neq 0. \quad \langle f(x) - S_n(f; x), \cos kx \rangle$$

$$= \langle f(x), \cos kx \rangle - \left\langle \frac{a_0}{2} + \sum_{l=1}^n (a_l \cos lx + b_l \sin lx), \cos kx \right\rangle$$

$$= \langle f(x), \cos kx \rangle - \langle \frac{a_0}{2} + \sum_{l=1}^n (a_l \cos lx + b_l \sin lx), \cos kx \rangle$$

$$= \pi a_k - \frac{1}{2} \sum_{l=1}^n (a_l \underbrace{\langle \cos lx, \cos kx \rangle}_{\substack{|| \\ \pi \quad l=k \\ 0 \quad l \neq k}} + b_l \underbrace{\langle \sin lx, \cos kx \rangle}_{|| 0})$$

$$= \pi a_k - \pi a_k = 0$$

$$\langle f(x) - S_n(f; x), \frac{a_0}{2} \rangle = \langle f(x), \frac{a_0}{2} \rangle - \langle \frac{a_0}{2} + \sum_{l=1}^n (a_l \cos lx + b_l \sin lx), \frac{a_0}{2} \rangle$$

$$= \frac{a_0}{2} \int_{-\pi}^{\pi} f(x) dx - \frac{a_0^2}{4} \int_{-\pi}^{\pi} dx = \frac{\pi}{2} a_0^2 - \frac{\pi}{2} a_0^2 = 0$$

$$f(x) - S_n(f; x) \perp \text{span} \{ \underbrace{\cos kx}_{k \geq 0}, \underbrace{\sin kx}_{k \geq 1} \}$$

$$\therefore \langle f(x) - S_n(f; x), S_n(f; x) \rangle = 0$$

$$0 \leq \|f(x) - S_n(f; x)\|_2^2 = \langle f(x) - S_n(f; x), f(x) \rangle$$

$$= \langle f(x), f(x) \rangle - \langle \frac{a_0}{2} + \sum_{k=1}^n (a_k \cos kx + b_k \sin kx), f(x) \rangle$$

$$= \int_{-\pi}^{\pi} f(x)^2 dx - \frac{a_0}{2} \int_{-\pi}^{\pi} f(x) dx - \sum_{k=1}^n (a_k \underbrace{\langle \cos kx, f(x) \rangle}_{|| \int_{-\pi}^{\pi} f(x) \cos kx dx = \pi a_k} + b_k \underbrace{\langle \sin kx, f(x) \rangle}_{|| \int_{-\pi}^{\pi} f(x) \sin kx dx = \pi b_k})$$

$$= \int_{-\pi}^{\pi} f(x)^2 dx - \pi \left[\frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + b_k^2) \right] \geq 0$$

$$\frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + b_k^2) \leq \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx \quad \forall n \geq 1.$$

$$\therefore \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \text{ 收敛}$$

$$\therefore a_n^2 + b_n^2 \rightarrow 0 \quad (n \rightarrow \infty) \Rightarrow \begin{cases} a_n \rightarrow 0 \\ b_n \rightarrow 0 \end{cases} \quad (n \rightarrow \infty)$$

定理1. 设 $f(x)$ 以 2π 为周期. 且 $f(x) \in R[-\pi, \pi]$. 令 $a_n, (n \geq 0), b_n$ 为 $f(x)$ Fourier 系数, $(n \geq 1)$

$$\text{则 } \frac{a_0^2}{2} + \sum_{k=1}^n (a_k^2 + b_k^2) \leq \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx \quad (\text{称为 Bessel 不等式})$$

(称为 Bessel 不等式)

$$\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \leq \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx$$

定理 2. 设 $f(x)$ 以 2π 为周期且 $f(x) \in R[-\pi, \pi]$. 则 $f(x)$ 的 Fourier 级数在 $[-\pi, \pi]$ 上平方平均收敛于 $f(x)$. 即 $\lim_{n \rightarrow \infty} \int_{-\pi}^{\pi} (f(x) - S_n(f; x))^2 dx = 0$.

定理 3. (Parseval 公式) 设 $f(x)$ 以 2π 为周期. 且 $f(x) \in R[-\pi, \pi]$.

令 a_0, a_n, b_n ($n \geq 1$) 是 $f(x)$ 的 Fourier 系数. 则

$$\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx$$

例 1. 设 $f(x) \in R[-\pi, \pi]$. a_n, b_n ($n \geq 1$) 为 $f(x)$ 的 Fourier 系数.

证明: $\sum_{n=1}^{\infty} a_n b_n$ 收敛.

证: $|a_n b_n| \leq \frac{1}{2} (a_n^2 + b_n^2)$

$\sum_{n=1}^{\infty} (a_n^2 + b_n^2)$ 收敛.

$\therefore \sum_{n=1}^{\infty} |a_n b_n|$ 收敛.

例 2. 设 $f(x) \in C[-\pi, \pi]$. 若 $f(x)$ 在 $[-\pi, \pi]$ 上的 Fourier 系数 $a_n = b_n = 0$, $a_0 = 0$ ($n \geq 1$).

则 $f(x) \equiv 0$.

证: 由 Parseval 公式.

$$\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx$$

||
0

$\therefore f(x) \in C[-\pi, \pi]$

$\therefore f(x)^2 \equiv 0$.

$\therefore f(x) \equiv 0$.

例 3. 将 $f(x) = x^2$ 在 $[-\pi, \pi]$ 上展开成以 2π 为周期 Fourier 级数. 并证明 $\sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90}$.

解: $b_n = 0 \quad \forall n \geq 1$.

$$a_0 = \frac{2}{\pi} \int_0^{\pi} x^2 dx = \frac{2}{3} \pi^2$$

$$\begin{aligned}
 a_n &= \frac{2}{\pi} \int_0^{\pi} x^2 \underbrace{\cos nx}_{\substack{! \\ 0}} dx = \frac{2}{n^2} x^2 \sin nx \Big|_0^{\pi} - \frac{2}{n^2} \int_0^{\pi} 2x \underbrace{\sin nx}_{\substack{! \\ 0}} dx \\
 &= \frac{4}{n^2} x \cos nx \Big|_0^{\pi} - \frac{4}{n^2} \int_0^{\pi} \cos nx dx \\
 &= \frac{4}{n^2} (-1)^n
 \end{aligned}$$

$$\therefore f(x) \sim \frac{\pi^2}{3} + 4 \sum_{n=1}^{\infty} \frac{(-1)^n}{n^2} \cos nx$$

$\therefore f(x)$ 在 $[-\pi, \pi]$ 上为分段可微的连续函数. $\therefore$ 由 Dirichlet 收敛定理

$$\frac{\pi^2}{3} + 4 \sum_{n=1}^{\infty} \frac{(-1)^n}{n^2} \cos nx = x^2, \quad \forall x \in [-\pi, \pi].$$

由 Parseval 定理: $\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx$

$$\therefore \frac{1}{2} \cdot \frac{4}{9} \pi^4 + \sum_{n=1}^{\infty} \frac{16}{n^4} = \frac{1}{\pi} \int_{-\pi}^{\pi} x^4 dx$$

$$\parallel \frac{2}{\pi} \int_0^{\pi} x^4 dx = \frac{2}{5} \pi^4.$$

$$\therefore \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{1}{16} \left(\frac{2}{5} - \frac{2}{9} \right) \pi^4 = \frac{\pi^4}{90}.$$

$$\int_a^{a+T} f(x) dx = \int_0^T f(x) dx.$$

推论 1. 设 $f(x), g(x)$ 是以 T 为周期且 $f(x) \in R[-\pi, \pi]$. 令 $a_0, a_n, b_n (n \geq 1)$ 为 $f(x)$ Fourier 系数.
 $c_0, c_n, d_n (n \geq 1)$ 为 $g(x)$ Fourier 系数.

$$\text{证: } \frac{1}{2} a_0 c_0 + \sum_{n=1}^{\infty} (a_n c_n + b_n d_n) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) g(x) dx.$$

$$\left. \begin{aligned}
 \text{证: } \text{由 Parseval 定理: } \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx \\
 \frac{c_0^2}{2} + \sum_{n=1}^{\infty} (c_n^2 + d_n^2) &= \frac{1}{\pi} \int_{-\pi}^{\pi} g(x)^2 dx
 \end{aligned} \right\}$$

$$f(x)g(x) = \frac{1}{2} \left[(f(x) + g(x))^2 - f(x)^2 - g(x)^2 \right]$$

$$\frac{1}{\pi} \int_{-\pi}^{\pi} f(x)g(x) dx = \frac{1}{2\pi} \left[\int_{-\pi}^{\pi} (f(x) + g(x))^2 dx - \int_{-\pi}^{\pi} f(x)^2 dx - \int_{-\pi}^{\pi} g(x)^2 dx \right]$$

$$\begin{aligned}
 \frac{1}{2} \int_{-\pi}^{\pi} f(x)g(x) dx &= \frac{1}{2} \left[\int_{-\pi}^{\pi} (f(x)+g(x))^2 dx - \int_{-\pi}^{\pi} f(x)^2 dx - \int_{-\pi}^{\pi} g(x)^2 dx \right] \\
 &= \frac{1}{2} \left\{ \frac{(a_0+c_0)^2}{2} + \sum_{n=1}^{\infty} [a_n+c_n]^2 + [b_n+d_n]^2 - \left[\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2+b_n^2) \right] - \left[\frac{c_0^2}{2} + \sum_{n=1}^{\infty} (c_n^2+d_n^2) \right] \right\} \\
 &= \frac{1}{2} a_0 c_0 + \sum_{n=1}^{\infty} (a_n c_n + b_n d_n)
 \end{aligned}$$

定理3. 设 $f(x) \in R[-\pi, \pi]$ 且以 2π 为周期. $f(x)$ 的 Fourier 级数 $f(x) \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$.

则 $\forall [a, b] \subset [-\pi, \pi]$.

$$\int_a^b f(x) dx = \int_a^b \frac{a_0}{2} dx + \sum_{n=1}^{\infty} \left(a_n \int_a^b \cos nx dx + b_n \int_a^b \sin nx dx \right)$$

证明: $\forall g(x) \in R[-\pi, \pi]$ 且以 2π 为周期.

其 Fourier 系数为 $c_0, c_n, d_n (n \geq 1)$

$$\therefore \frac{1}{2} \int_{-\pi}^{\pi} f(x)g(x) dx = \frac{a_0 c_0}{2} + \sum_{n=1}^{\infty} (a_n c_n + b_n d_n)$$

$\forall [a, b] \subset [-\pi, \pi]$

$$g(x) = \begin{cases} 1 & x \in [a, b] \\ 0 & x \in [-\pi, a) \cup (b, \pi] \end{cases}$$

$$\begin{aligned}
 \frac{1}{2} \int_a^b f(x) dx &= \frac{1}{2} \int_a^b \frac{a_0}{2} dx + \sum_{n=1}^{\infty} \left(a_n \frac{1}{2} \int_{-\pi}^{\pi} g(x) \cos nx dx + b_n \frac{1}{2} \int_{-\pi}^{\pi} g(x) \sin nx dx \right) \\
 &= \frac{1}{2} \int_a^b \frac{a_0}{2} dx + \frac{1}{2} \sum_{n=1}^{\infty} \left(a_n \int_a^b \cos nx dx + b_n \int_a^b \sin nx dx \right)
 \end{aligned}$$

$$\frac{\partial f}{\partial n} = \nabla f \cdot \frac{\vec{n}}{\|\vec{n}\|}$$

$$\text{grad } f(x) = (f'_x, f'_y) \Big|_M = \nabla f(M).$$

$$\oint_{\partial D} p dx + q dy = \iint_D (Q'_x - P'_y) dx dy$$

$P, Q \in C(D)$.

$$EF - G^2 = A^2 + B^2 + C^2. \quad (A, B, C)$$

$$\dots \dots \dots$$

$$C_1 - C_2 = A + B + C \quad (A, B, C)$$

$$S(x) = \sum_{n=0}^{\infty} a_n x^n \quad (-r, r)$$

$x \neq 0$

$$\left(\frac{1}{x}\right)$$

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \rho$$

$$r = \frac{1}{\rho}$$

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \rho$$

$\sum_{n=0}^{\infty} a_n r^n$ 收敛. $S(x)$ 在 r 左连续.

$$\sum_{n=0}^{\infty} \frac{a_n x^n}{n!}$$

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} \quad \forall x \in \mathbb{R}$$

$$\sin x$$

$$\cos x$$

$$\ln(1+x)$$

$$(1+x)^\alpha$$

$$\forall x \in \mathbb{R}^n$$

$$\{e_i\}_{i=1}^n$$

$$x = \sum_{i=1}^n \alpha_i e_i$$

$$\|x\|^2 = \sum_{i=1}^n \alpha_i^2$$

$$\alpha_i = \langle x, e_i \rangle$$

$$R[-\pi, \pi]$$

$$\int_{-\pi}^{\pi} dx = 2\pi$$

$$\frac{1}{\sqrt{2\pi}}, \frac{\cos x}{\sqrt{2\pi}}, \frac{\sin x}{\sqrt{2\pi}}, \frac{\cos 2x}{\sqrt{2\pi}}, \frac{\sin 2x}{\sqrt{2\pi}}, \dots, \frac{\cos nx}{\sqrt{2\pi}}, \frac{\sin nx}{\sqrt{2\pi}}, \dots \text{ 正交完备.}$$

$$\pi \frac{a_0^2}{2} + \pi \sum_{n=1}^{\infty} (a_n^2 + b_n^2) = \|f\|_2^2$$

$$a_0 = \frac{1}{\pi} \langle f(x), 1 \rangle = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$

$$a_0 = \frac{1}{\pi} \langle f(x), 1 \rangle$$

$$\sqrt{\frac{\pi}{2}} a_0 = c_0$$

$$= \sqrt{\frac{\pi}{2}} \langle f(x), \frac{1}{\sqrt{2\pi}} \rangle$$

$$= \sqrt{\frac{\pi}{2}} \langle f(x), \underbrace{\frac{1}{\sqrt{2\pi}}}_{\varphi_0} \rangle$$

设 φ_k 为 $R[-\pi, \pi]$ 的一组正交基

$$c_k = \langle f(x), \varphi_k \rangle$$

$$\text{若 } \|f\|_2^2 = \sum_{k=0}^{\infty} c_k^2, \text{ 称 } \{\varphi_k\} \text{ 为 } R[-\pi, \pi] \text{ 上完备.}$$

$\|f\|_2^2 = \sum_{k=0}^{\infty} c_k^2$, 标 $\{\varphi_k\}$ 为 $L^2(\mathbb{R})$ 上完备.
